

TABLE 2.2 METHODS OF IMPLEMENTING A NEW PROGRAM

Method	Description	Diagram
Parallel implementation	The old and the new program work together for a period of time	
Direct cut over	The new program immediately replaces the old program	
Phased implementation	One or more tasks of the new program are gradually implemented until the new program takes over all tasks of the old program	
Method	Description	Diagram
Pilot implementation	One section of the organisation uses the new program and all other sections continue with the old program until a decision is made to put the new program into place across the whole system	

TABLE 2.3 ADVANTAGES AND DISADVANTAGES OF DIFFERENT METHODS OF IMPLEMENTATION

Method	Advantages	Disadvantage
Phased	- Each task can be individually tested as it is implemented - Training users is simpler as only one new task has to be learned	- Difficult for users to separate the old and the new programs and operate different task in each system - Longer time-frame leads to higher implementation costs
Direct Cut over	- Reduced implementation costs compared to other methods - Less pressure on users as only one program is in place	- Data transfer from old to new program has to be done very quickly - Testing of new program in operation leave no fallback to old program if there are problems - User stress as training needs to be done before new program is in place and while old program is still operating
Parallel	- Two programs can be compared and any problems can be fixed to take account of differences - Testing and fixing of problems in new program is simpler as old program is still available for use in an emergency	- User stress as both old and new programs have to be operated for conversion time - Confusion between programs if close records are not kept e.g. which program is the most current? - If there are large changes in operating procedures between the old and new programs there can be problems for users - More expensive than other methods due to dual costs
Pilot	- Risk is confined to one section of an organisation - Testing and fixing of problems in the new program is simpler as the old program is still available for use in other parts of the organisation	Larger organisations usually required to use this method, particularly multiple sites doing the same tasks such as one bank among a series of bank branches
